Case Study

An 18 year old professional dancer came to me with pain in her left groin and her left lateral foot. She was given chiropractic treatment for balance of the pelvis and lumbar treatment for her left foot.

After two weeks there was an improvement in her left groin but not in her lateral foot.

At this point we added treatment with B-Cure Laser to the painful area of her foot in addition to the existing treatment, once at every visit, for 6 minutes. After two visits a week apart, there was complete recovery from the pain in her foot.

After a month of further routine dance training with no treatment to the area, the pain came back in the same place. Therefore the combined treatment was renewed using the B-Cure Laser and once again complete recovery was achieved in two visits two weeks apart.

Routine training was renewed and there were no further complaints reported.

The results:

Very fast improvement to her foot pain, in all ranges of movement and putting full load on it during dancing.

Conclusions:

Integrating the use of the B-Cure Laser Sport in the clinic for cases of Sprain and Strain injuries increases the efficacy of treatment, shortens recovery time and allows a quick return to the routine athletic training.
