Case study:

A 29 year old basket ball player presented with pain in the left Achilles tendon after falling on the foot in a game. In addition to Chiropractic adjustment of the pelvis, trigger points were activated in the area of the tendon and the left calf, and this was combined with B-Cure Laser treatment of the tendon itself (for about 5 minutes).

Results:

The patient reported significant relief from pain in the tendon after one treatment. We continued treatment three times, once a week (he was unable to come more often) and complete recovery with no pain in the tendon and the ankle during training.

Conclusions:

Combining B-Cure Laser treatment for injuries of strained tendons and ligaments and sprains is highly effective in healing the area of the injury and in granting fast relief from pain.
